19. Credits and Thanks

2  **Ultimate Parkour FPS - Character Controller** is an easy-to-use package that features everything you need to start your own First Person Shooter game from fluid parkour movement to weapon mechanics.

 The weapon system includes the following **features**:

- **Health** and **Damage** system.
- Shooting and **Recoil** system.
- Reloading and **Ammo** system.
- Weapon Switching.
- **Weapon Sway** and **Headbob** visual effects.
- Example weapon models and animations.

 The character controller includes the following **abilities**:
(you can disable/enable any ability to your liking)

- Walking
- Crouching
- Running
- Jumping
- Double Jump
- **Wall Running**
- **Wall Jumping**
- **Sliding**

 The controller also includes the following **features**:

- Unique **Momentum** system that increases the player's speed when performing actions like running and sliding.
- **Stamina** system.
- **Gravity** and **Drag** control.
- **Slope** movement and speed control.
- **Field of View** control.
- **Input Buttons** customization.
- Smooth movement and controls thanks to **Coyote Jump** and **Input Buffering**.

 **Bonuses** included in the package:

- Player and weapons **Sound Effects**.
- **Cursor** and **Mouse** customization (with built-in custom cursor and mouse sprites).
- **Speed Lines** visual effect.
- **UI** icons and sprites.

 The package is **easy to use** for beginners without the need for coding and it also allows for **customization** for advanced users thanks to extensive documentation.

 The package includes a **Demo Scene** and a **Player Prefab** showcasing all the features.

Quick Start

For a quick start example please look at the **Example Scene** under the **Scenes** folder:

To get started in a new scene simply drag and drop the **Player Controller** prefab into any scene:

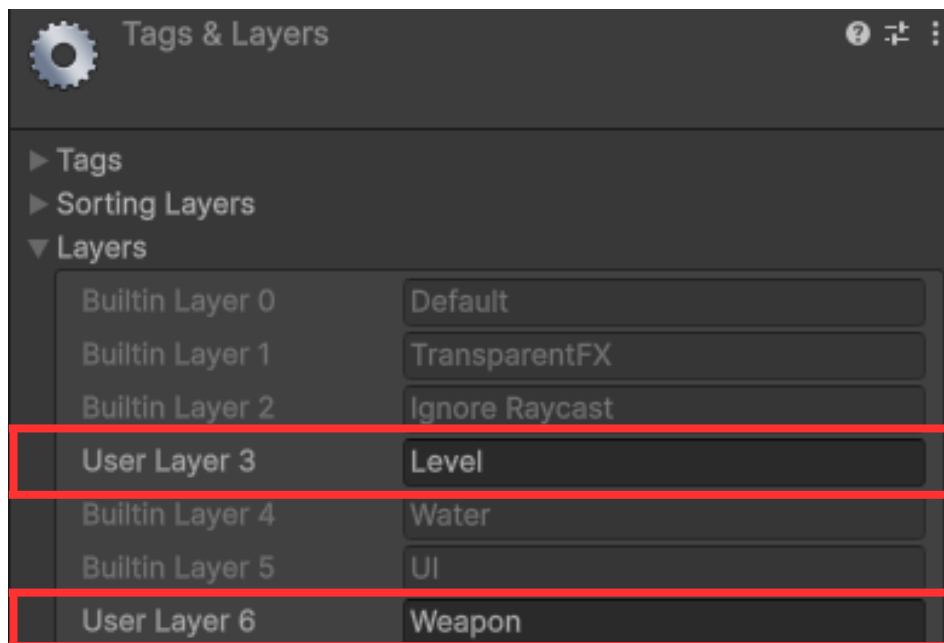

Quick Start

When first opening the project, make sure the **Layers** were imported correctly.

If not, you will need to create the following layers manually:

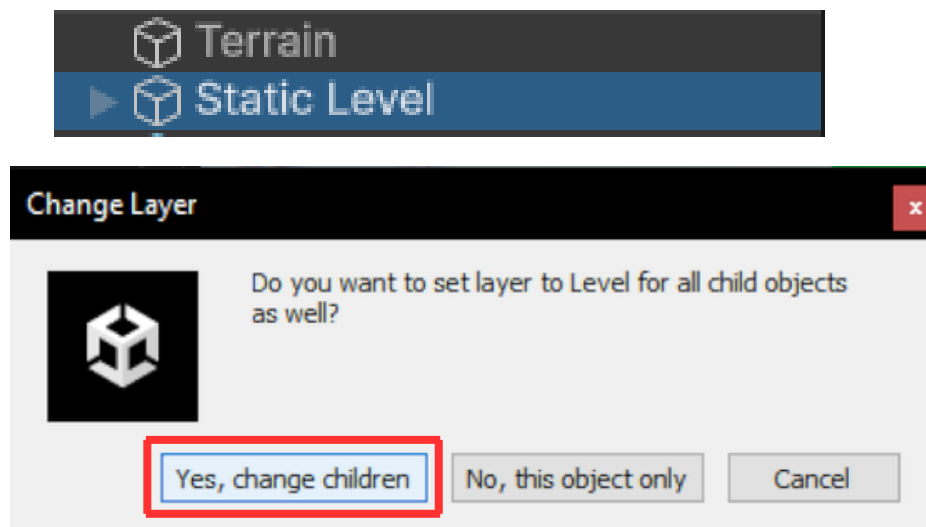

- Level
- Weapon

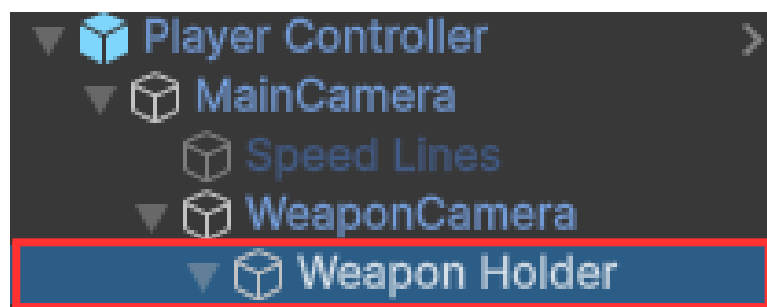

And follow the steps in the next pages:

Quick Start

After creating the layers, assign the **Level** layer to the Terrain and Static Level objects:

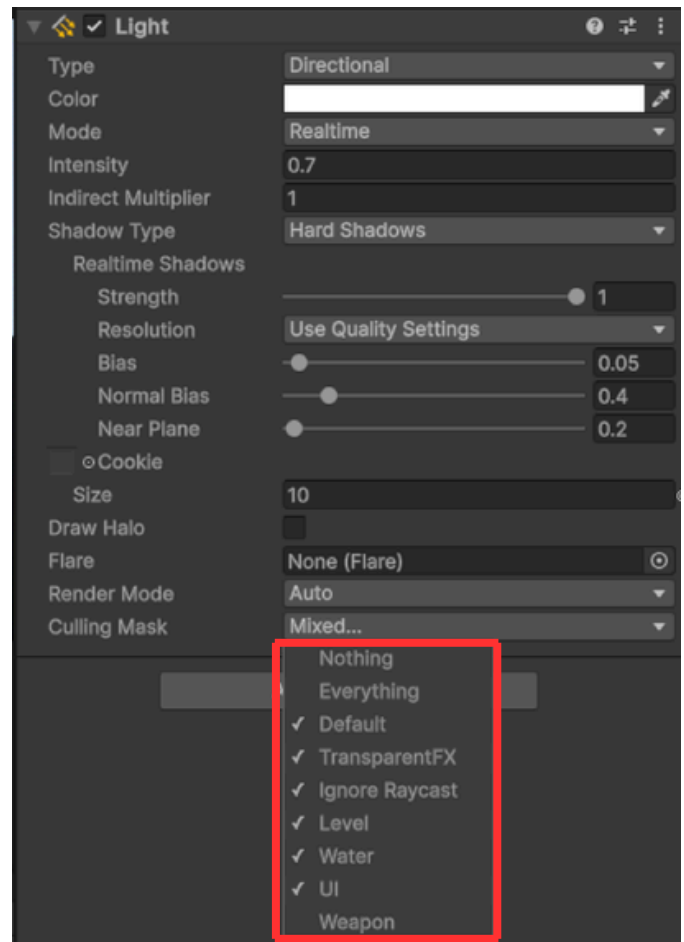

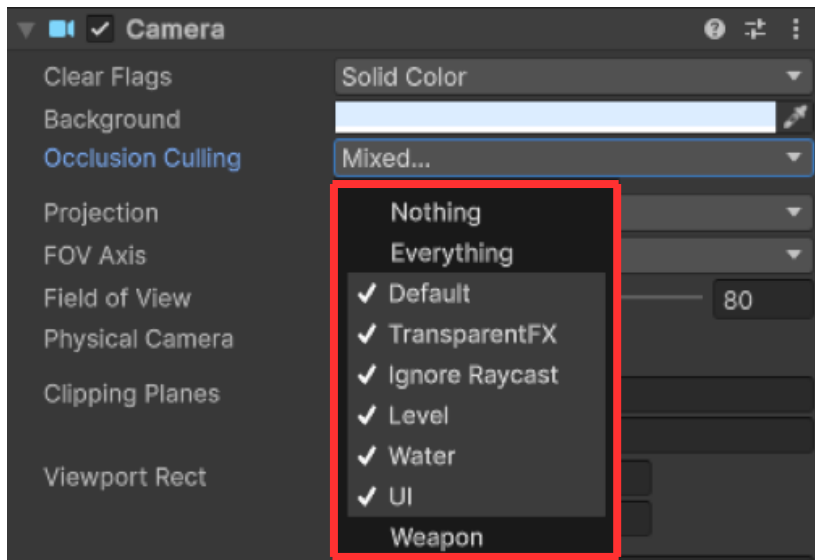

Assign the **Weapon** layer to the Weapon Holder object under the Player Controller:

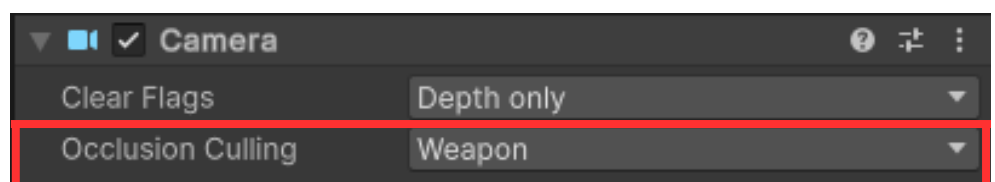

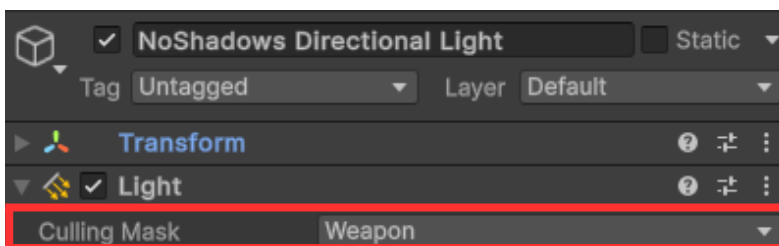

Quick Start

Make sure that the **MainCamera** and the **Directional Light** draw every layer apart from **Weapon**:

And the **WeaponCamera** and **NoShadows Directional Light** draw only the **Weapon** layer:

Character Controller

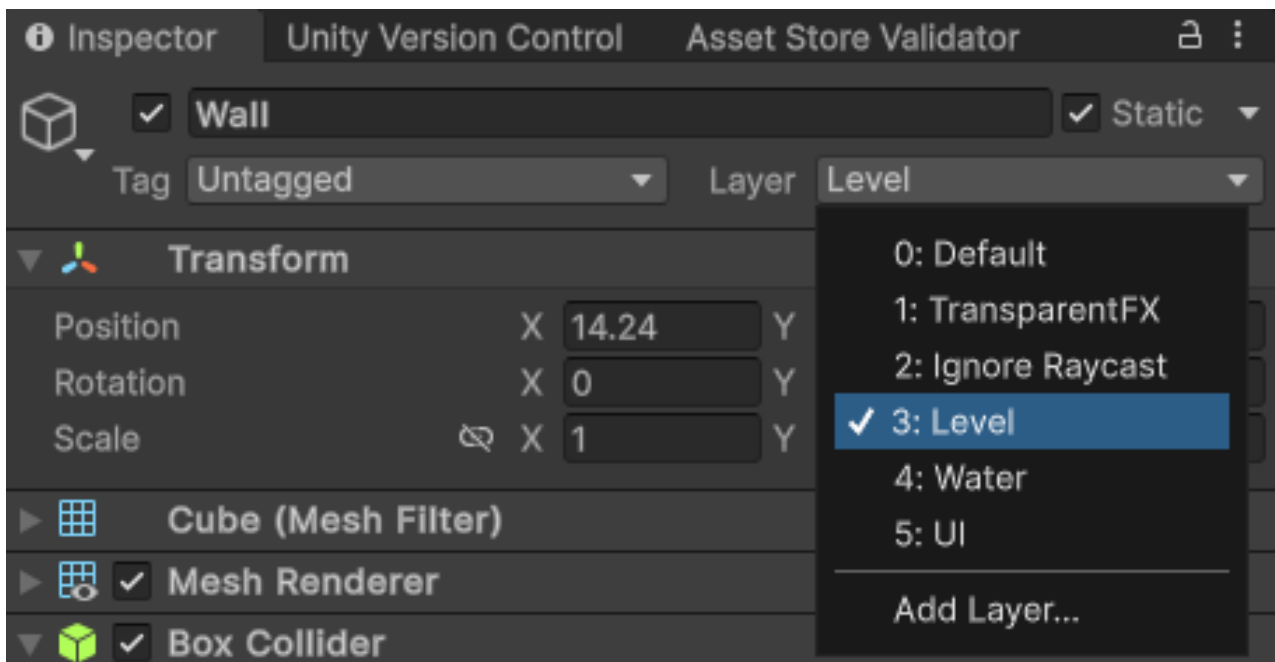

All of the character controller parameters like (Walking, Running, Wall Jumping, etc..) are configurable within the **Player Controller** script of the **Character Controller** prefab:

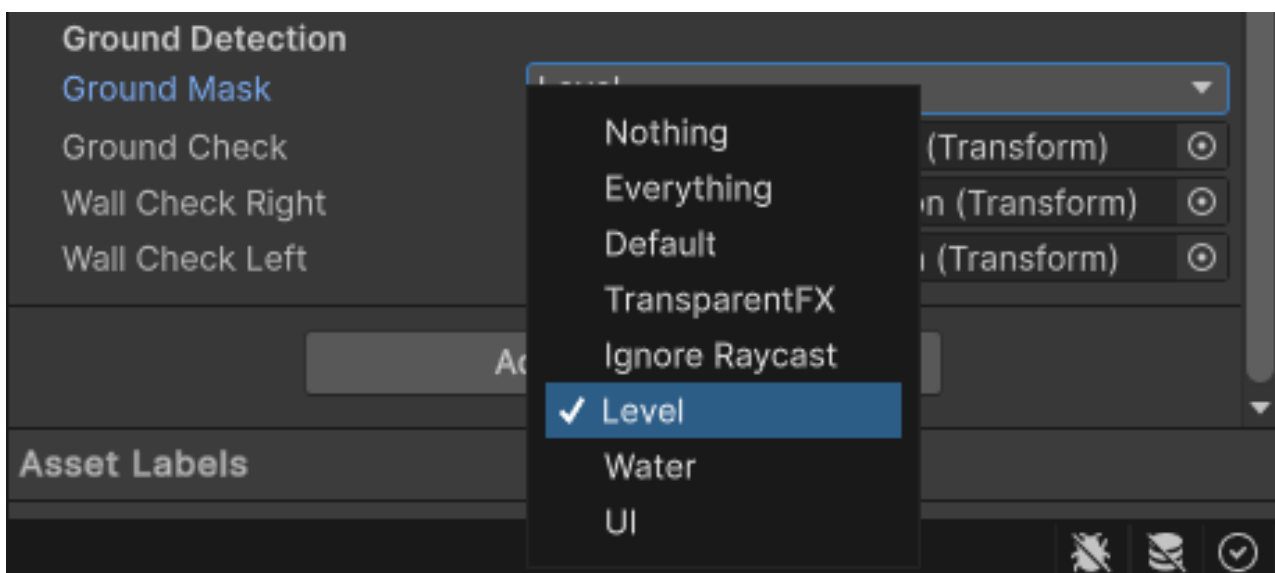

Here you can also change the **Input Buttons** for the player movement abilities, and the **Sound Effects**.

Character Controller

To mark any surface/object you want as interactable by the player, put it in a seperate layer:

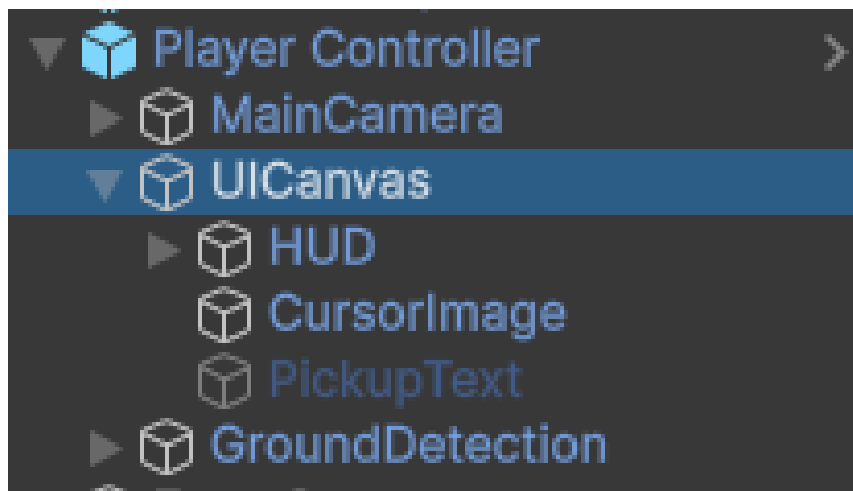

Make sure to choose that layer in the **Player Controller** script under "Ground Mask" in "Ground Detection":

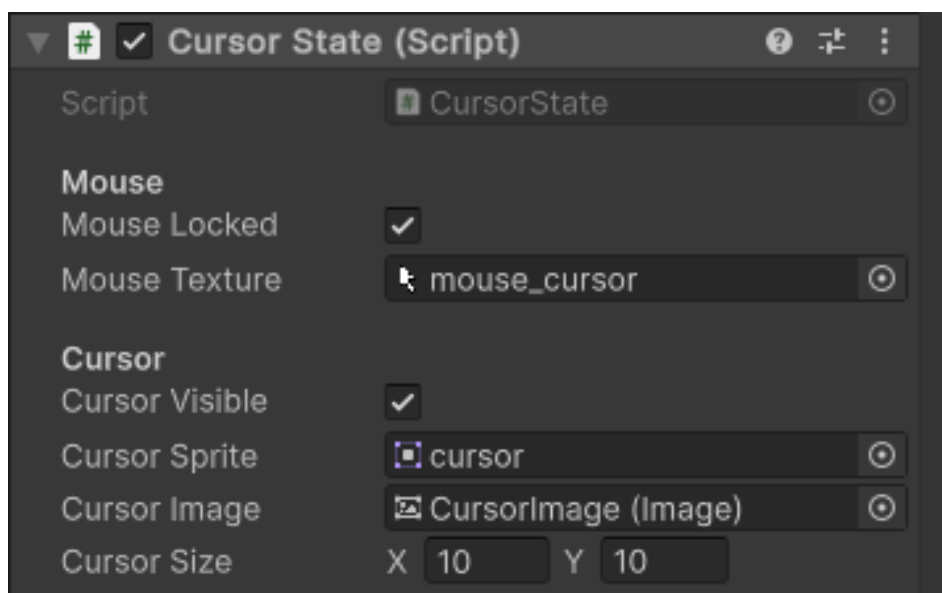

Character Controller

If you wish to modify the UI elements look under the **UICanvas** object in the **Player Controller** prefab, you can delete them freely:

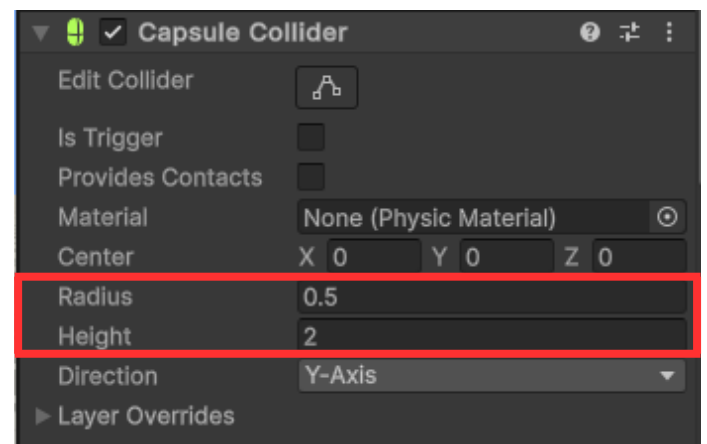

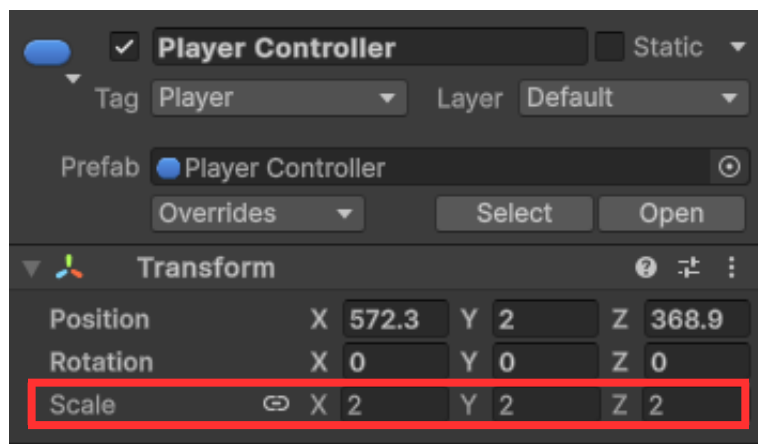

You can also control the cursor and mouse by changing the **Cursor State** script parameters in the **Player Controller**:

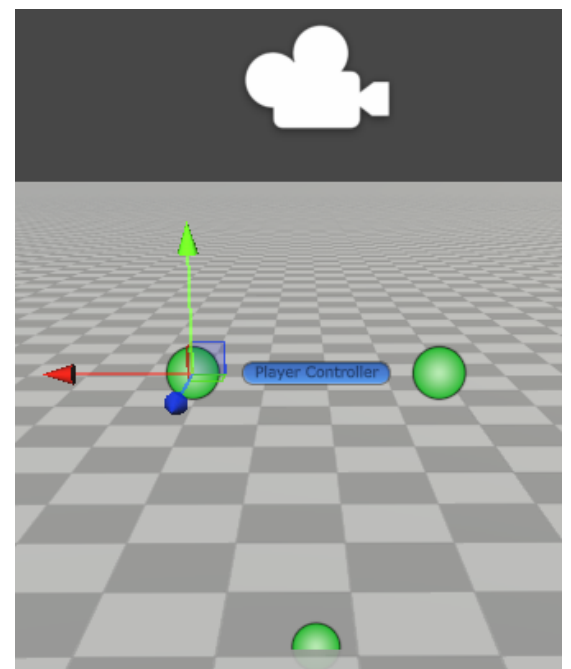

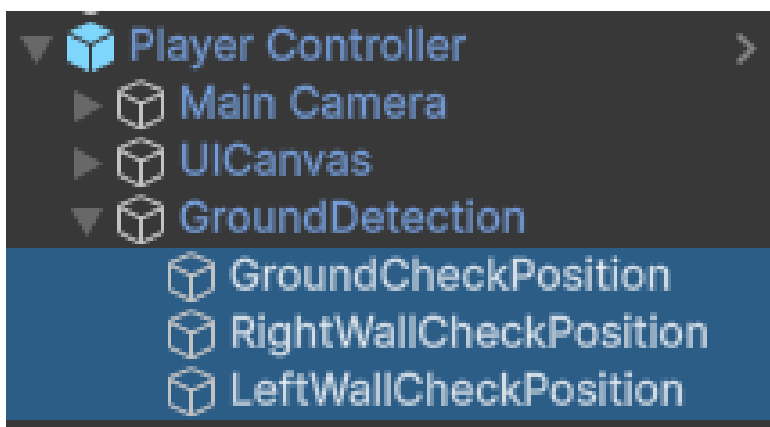

Character Controller

If you want to modify the size of the player you can do so by changing the **Player Controller** scale and **Capsule Collider** accordingly:

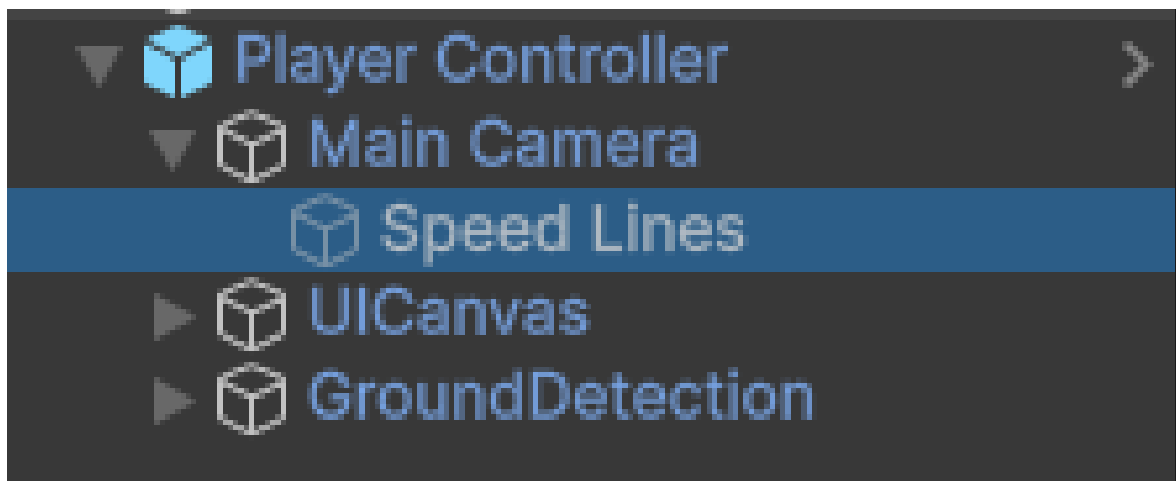

Make sure to move the ground and wall detection points under the **GroundDetection** object in the **Player Controller** prefab:

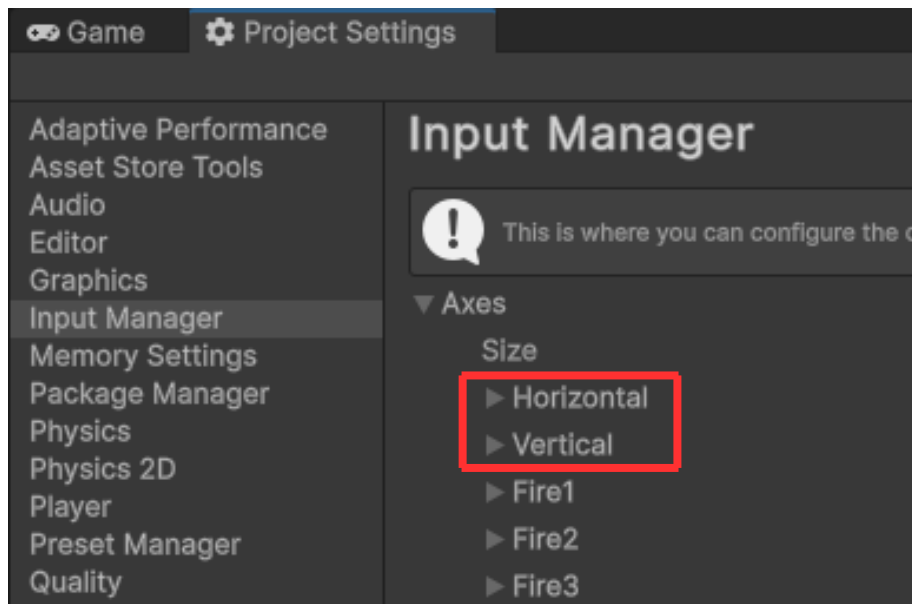

Character Controller

If you wish to disable the **Speed Lines** simply delete the **Speed Lines** object under the **Main Camera** object in the **Player Controller** prefab:

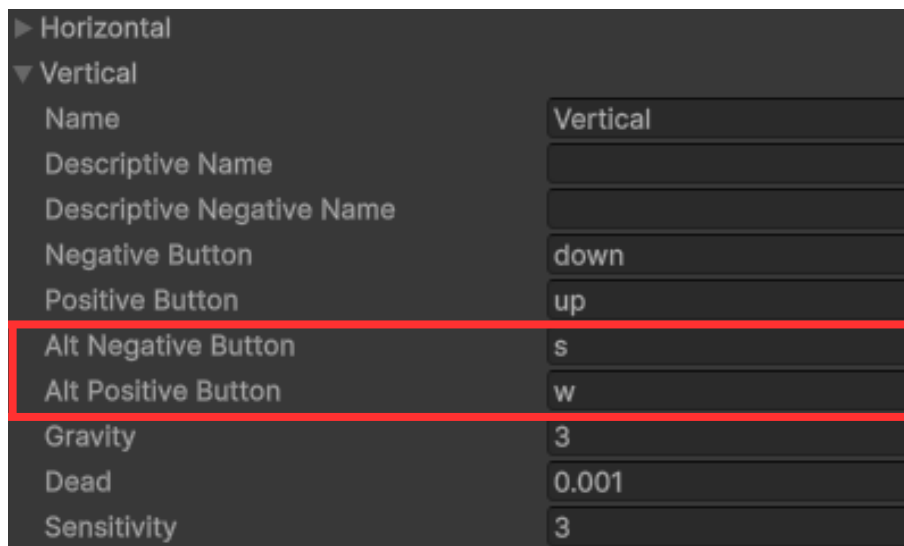

Character Controller

The movement controls are set in Unity's **Input Manager** window under **Vertical** and **Horizontal**:

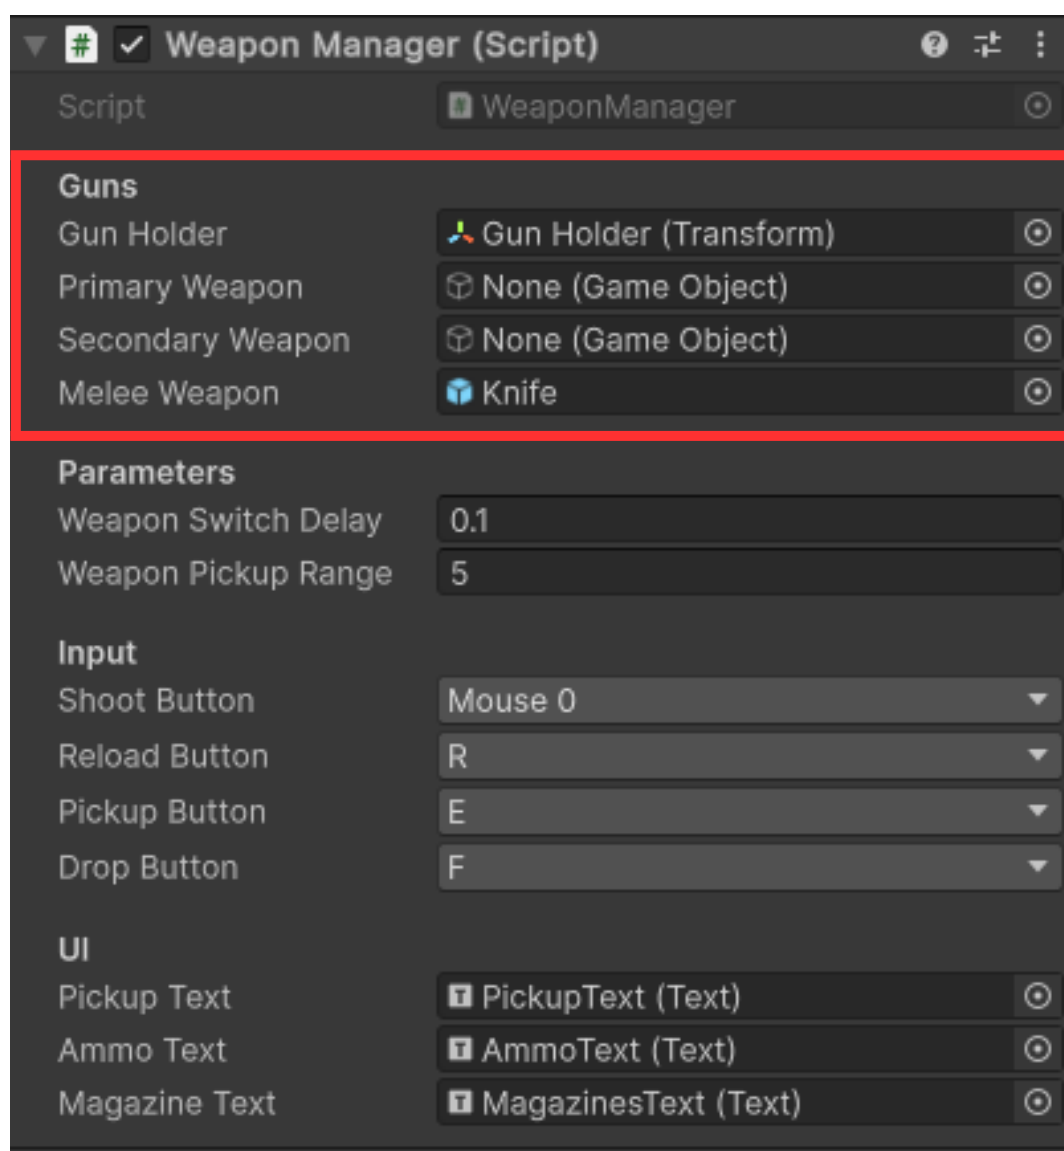

If you wish to change from the standard WASD controls simply change the buttons in the input manager:

Weapon Manager

To change what weapons the player starts with you can set them under the **Weapon Manager** script of the **Player Controller** prefab:

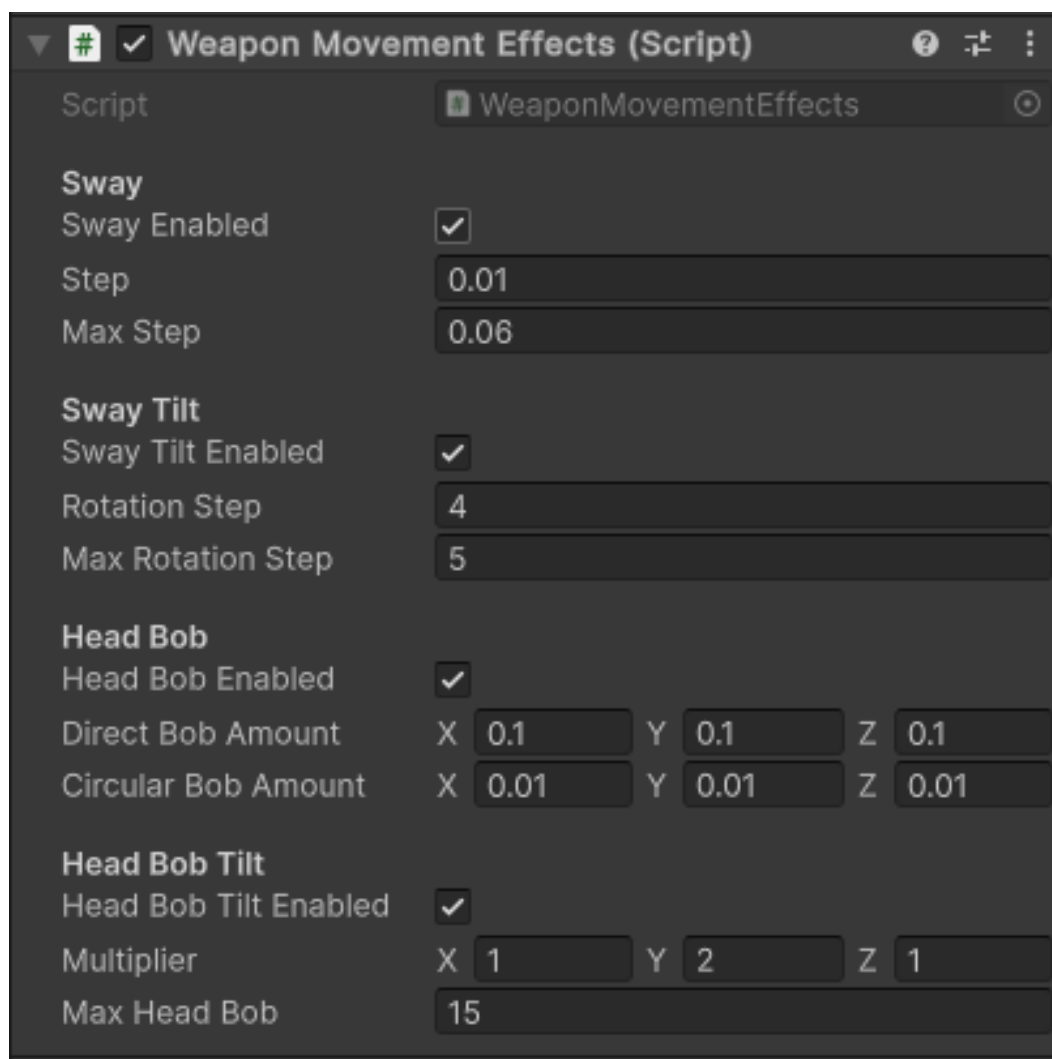

There you can also change the **Input Buttons** and **UI Elements** for the weapon system.

Weapon Sway & Headbob

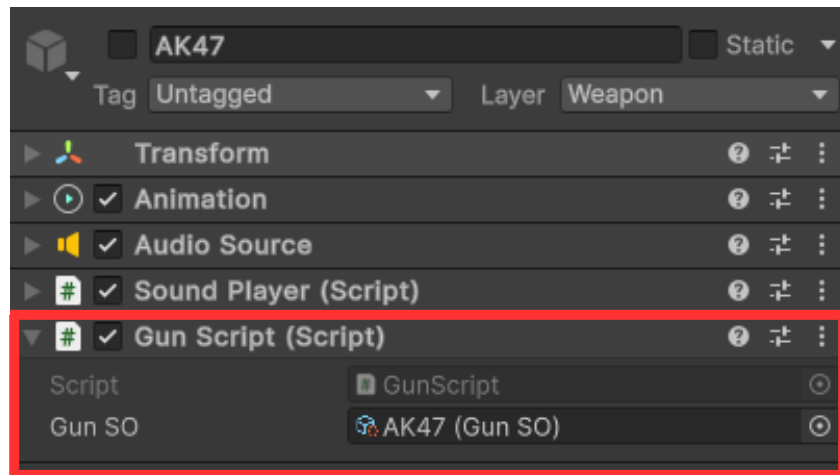

The **Weapon Sway** and **Headbob** movement effects are automatically applied to any gun that the player equips.

Changing the effects look and intensity can be done in the **Weapon Movement Effects** scripts under the **Weapon Holder** object of the player controller:

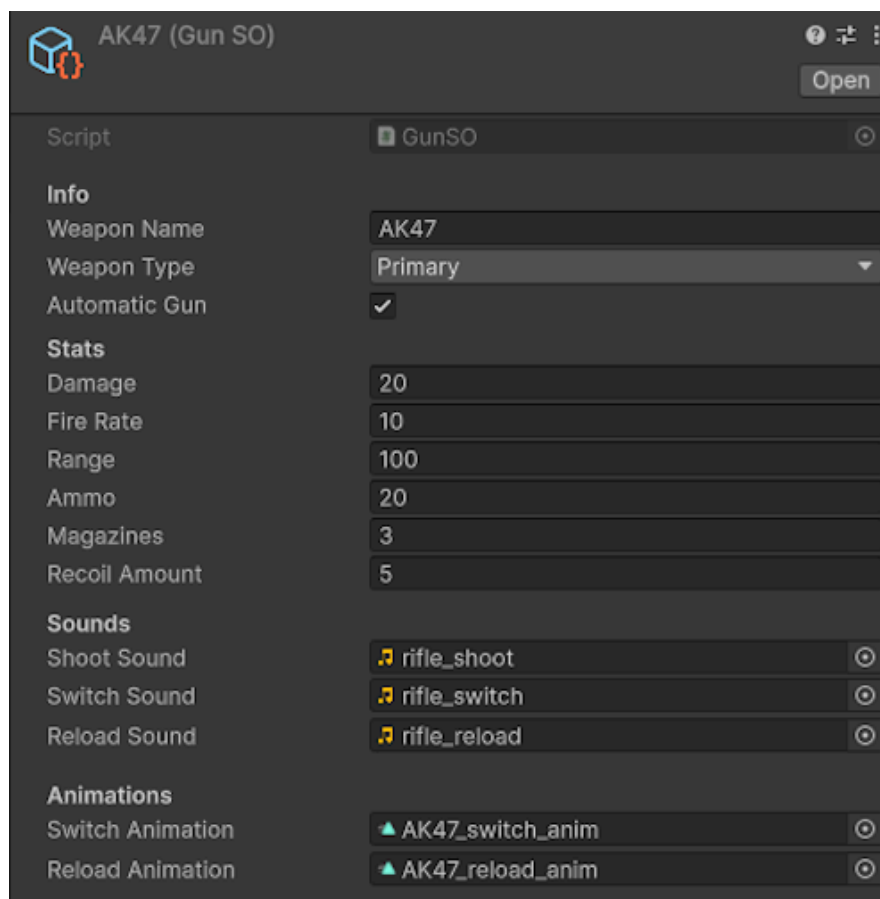

Weapon Customization

Each of the weapons of the player controller contains a **Weapon Scriptable Object** parameter, which holds the scriptable object for the specific weapon:

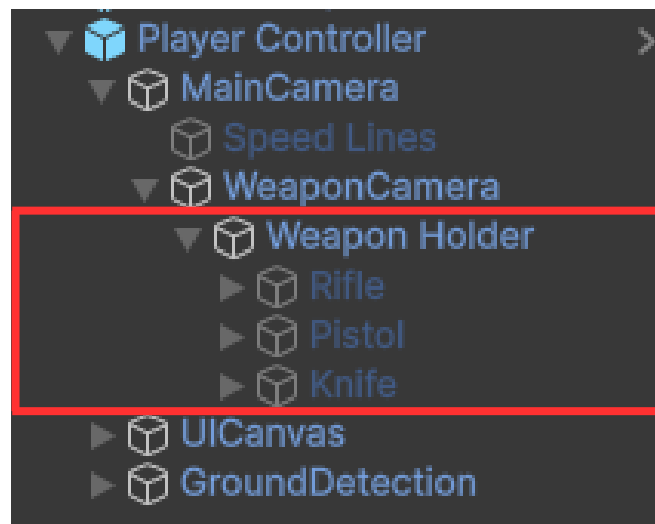

In the scriptable object you can change the **Stats, Sound Effects and Animations** for every gun:

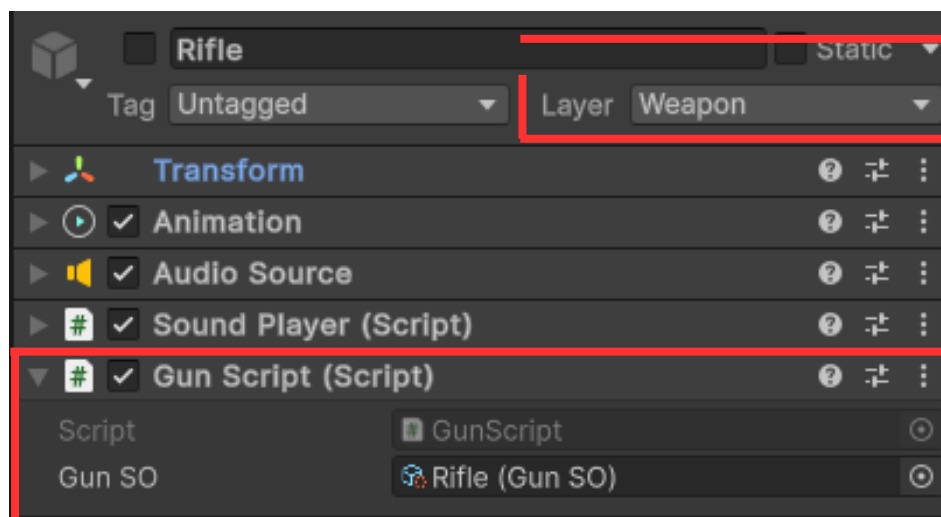

Make Your Own Guns

In order to add your own guns you first need a **Model** for your new gun.

After you have a model you can drop it under the **Weapon Holder** component of the **Player Controller**:

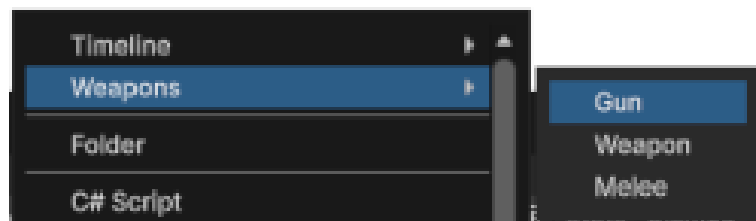

Make sure the new gun object contains the **Gun Script** component (or melee script), and it's **Layer** is marked as **Weapon**:

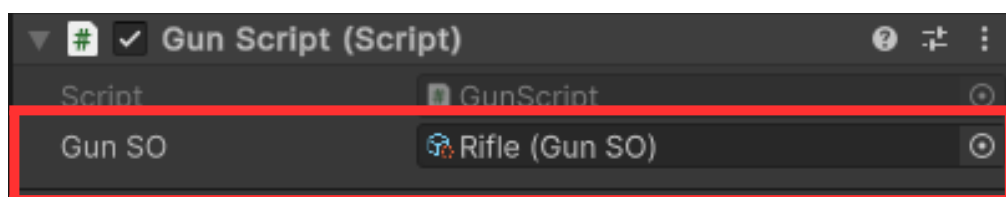

Make Your Own Guns

After adding the gun object to the player controller, you need to create a new **Weapon Scriptable Object** to hold the gun's stats, animations and sounds:

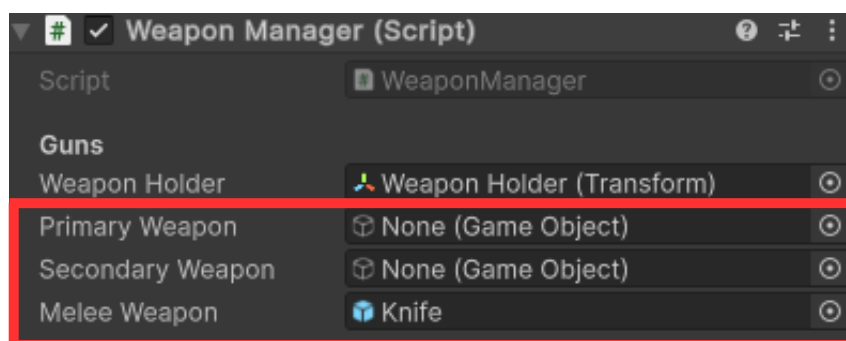

(Right click in project folder > Create > Weapons > Gun)

Then after setting the stats of the gun in the scriptable object, drag it to the Gun Script component of the gun.

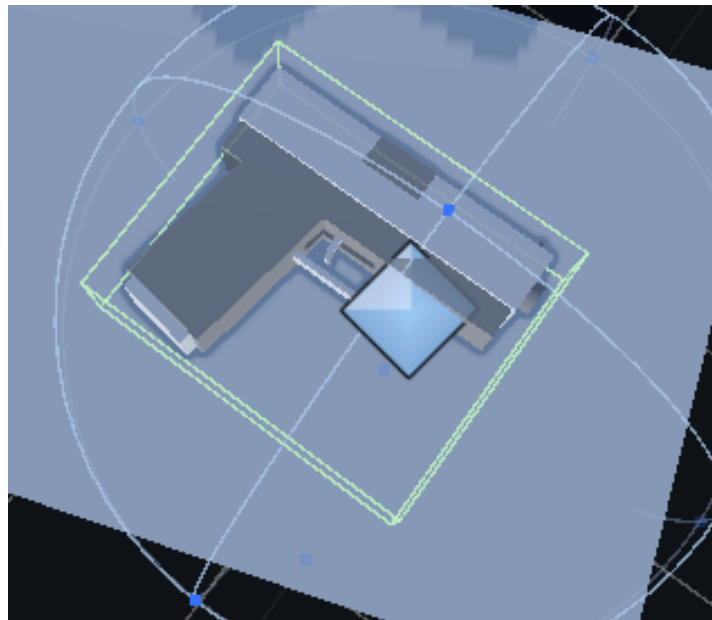

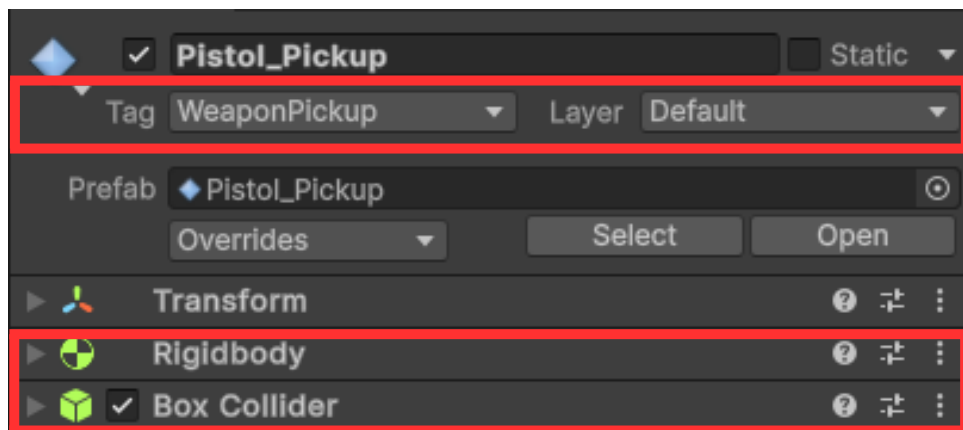

*If you want the player to start with the new gun equipped, you can set it in the **Weapon Manager** script:

Make Your Own Guns

If you want to make a **Pick-Up** object for your gun:

- copy the gun from the **Weapon Holder** to the Scene.
- Add to the weapon object a **Rigid Body** and a **Collider**.
- Set the **Tag** of the pickup object as **Weapon Pickup**, and the **Layer** as **Default**.

Thank you for buying and using
my package!
